- ☐ 3rd year

Respondent Demographics

Branch Distribution

Year Distribution

Total Responses: 66

- Students from multiple engineering disciplines participated.
- Representation across different academic years ensured diversity in the dataset.
- The sample provides a reliable basis for analyzing productivity and academic performance patterns.
- Insights are derived from self-reported student data.

Impact of Daily Habits on Productivity

Key Findings

- 🛌 Students sleeping 7–8 hours generally reported higher productivity levels.
- 📱 Excessive screen time showed a negative relationship with productivity.
- 📶 Healthy lifestyle habits appear to contribute positively to student productivity.

Key Productivity Drivers

Management Interpretation

-  Consistent study habits were associated with higher productivity scores.
-  Higher stress levels corresponded with reduced productivity.
-  Effective time management and stress management may improve student performance.

Academic Performance Analysis

Higher academic attendance was associated with stronger academic performance.

Productive students generally achieved higher CGPA scores.

Increased stress levels were linked to lower academic performance.

Consistent study habits contributed positively to CGPA.

Productivity and Academic Success

66

Responses

Sleep

Positive Impact

Study Hours

Positive Impact

Stress

Negative Impact

The analysis indicates that productivity and academic performance are strongly influenced by sleep quality, study habits, attendance, screen time and stress management.

Students who maintained healthier habits generally demonstrated better productivity and academic outcomes.

Key Insights

Higher sleep duration was associated with higher productivity levels.

Higher screen time was associated with lower productivity levels.

Consistent study hours were associated with better outcomes.

Higher attendance was associated with better CGPA.

Higher stress was associated with lower productivity and CGPA.

Recommendations

These recommendations focus on improving productivity and academic outcomes through healthy habits, structured study routines and better stress management.

Conclusion

This study identified key behavioral and academic factors associated with student productivity and academic performance.

The findings demonstrate that sleep quality, study habits, attendance, lower screen time and stress management all contribute to student success.

These insights can support data-driven strategies to improve student outcomes.

A light gray background graphic featuring a stylized person on the left with their arm extended, pointing towards a large rectangular screen on the right. The person is represented by a simple oval head and a trapezoidal body. The screen is a large rectangle with rounded corners. The text "Thank You" is centered on the screen.

**Thank
You**
